

How to Calculate Your Quarantine End Date When You Live With a Person Who Tested Positive

When you live with someone who has tested positive, your quarantine order will have an end date of 20 days out from the date you were placed into quarantine. You can calculate your actual quarantine end date based off of the descriptions and formulas below, pending confirmation from the local health department. If symptoms occur, a quarantine of 14 days is required.

1. If you live with someone who has COVID-19 (e.g.; roommate, partner, family member), and that person has isolated by staying in a separate bedroom and you have had no more contact with that person. Your last day of quarantine is 10 days from your last date of contact.

2. If you live with someone who has COVID-19 and you cannot separate from that person (e.g., you are providing direct care for them while they are sick, there are no separate bedrooms, or you live in close quarters and you are unable to keep 6 ft away). Your last day of quarantine is 10 days after the person who has COVID-19 meets the criteria to end isolation.

3. If you live with someone who has COVID-19 and you started your 10-day quarantine, but you ended up having contact with that person during your quarantine period. You will have to restart your quarantine period from the last day you had contact with the person who has COVID-19.
